What's New In JavaScript SiteSearch Generator?

Comes with a set of pre-written search snippets, or you can create your own. The engine has a built-in search engine manager, that manages and parses your text files. It can support tags, attribute names, attribute values, text between tags, HTML tags, CSS styles, CSS properties, or any other part of your text documents. It supports natural language queries, for example:'search in all pages for div with attribute class="myclass" and that matches all phrases'. The

engine can parse each page and extract all the content or the main tags. It can be used as a simple search engine, that parses all the pages on a site and generates an index for the text documents, so you can run a search there for any text. It can be used as a 'full-text search engine' that only parses your documents and generates an index for you, so you can use it with third-party search engines. The index can be generated for your own site, and it allows for the same type of queries as a site search engine. It can also be used as a supporting command-line tool for parsing large number of files and generating an index for you. You can customise it using language files, you can define your own custom search snippets. You can use it as a standalone tool, or you can download the website using it to use the pre-written search snippets or add your own. SiteSearch Generator is all open source code, hosted and maintained on GitHub, and available free of charge. The project is hosted on GitHub. There is also an updated Wiki available with more detailed information about the engine. SiteSearch Generator is developed by Diez & Quevy. You can contact us here.
